

# kelso\_model

Version 2 • Checked today 03:02

The verdict

Not ready to send. Five findings, three of them material.

This copy carries values only – 814 of 470,594 cells hold a formula – so the rules that read how the model is built saw almost none of it. What the value-reading checks did find: three structural exceptions. Each is named with its cell or page overleaf, and they should clear before this model leaves the deal team.

What was checked

Read against the FAST and ICAEW conventions and against the model’s own check rows. Every finding carries the cell – or the document and page – it came from.

| Model      | kelso_model, version 2         |
| Checked    | Today 03:02                    |
| Cells read | 470,594 • 814 of them formulas |

How much was covered

No deck or memo has been reconciled against this model, so no figures were checked.  
What follows is the model read against itself.

What could not be checked

- ReportFinStatsSA: the net-assets and equity rows are not unique (2 and 1 candidates) – not paired, not guessed.
- ReportFinStatsAnnual: the net-assets and equity rows are not unique (2 and 1 candidates) – not paired, not guessed.
- This copy carries values only, so the construction rules could not read its formulas.
- Model inputs that are judgement calls are not checked – only their sourcing is.
- The arithmetic has not been re-run through the recalculation engine – the mark can be earned from the model’s own page.

## The material findings

Three findings that change a number someone will act on. Each is cited – the cell, or the document and page – so the owner can go straight to it.

- The model's own check rows are firing

01

calcFundingSA!M712

33.64 on the model's own « CHECK » row, built to read zero

The model's own check row « CHECK » reports 33.64 in FY2018 – a row that is zero everywhere else.

calcFundingSA!N712

16.3 on the model's own « CHECK » row, built to read zero

The model's own check row « CHECK » reports 16.3 in FY2018 – a row that is zero everywhere else.

calcFundingSA!O712

6.818 on the model's own « CHECK » row, built to read zero

The model's own check row « CHECK » reports 6.818 in FY2019 – a row that is zero everywhere else.

## Everything else

Two findings worth clearing but that would not on their own hold the model back. One line each.

- Auditability risks

338 defined names point into other workbooks that are not here (IRRSHARINGREQ, `kelso_model.xlsm` ModStartDate, Period, Sheet, TotalGearing\_Offset, UC\_Offset and 332 more) — IRRSHARINGREQ reads [1]Checks!\$H\$110. They raise update prompts on open and cannot be checked.

---

« Sheet1 » is hidden — it is in the workbook and one right-click away from visible.

Sheet1!A1

## What this doesn't tell you

- Whether the deal is a good deal. Swens checks that the model holds together, not that the answer is right.
- Whether the assumptions are reasonable — only whether each typed input can be traced to a source.
